## Integrated Systems

A closed-circuit ecosystem, with completely self-sufficient water usage. Faucet, dishwasher employs water from the same source.

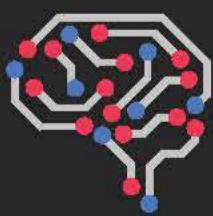

## Dynamic Sensors

Use of sensors to detect system faults, leakages and potential failures to create early warning for repairs and replacement.

## Multi-faceted Nozzles

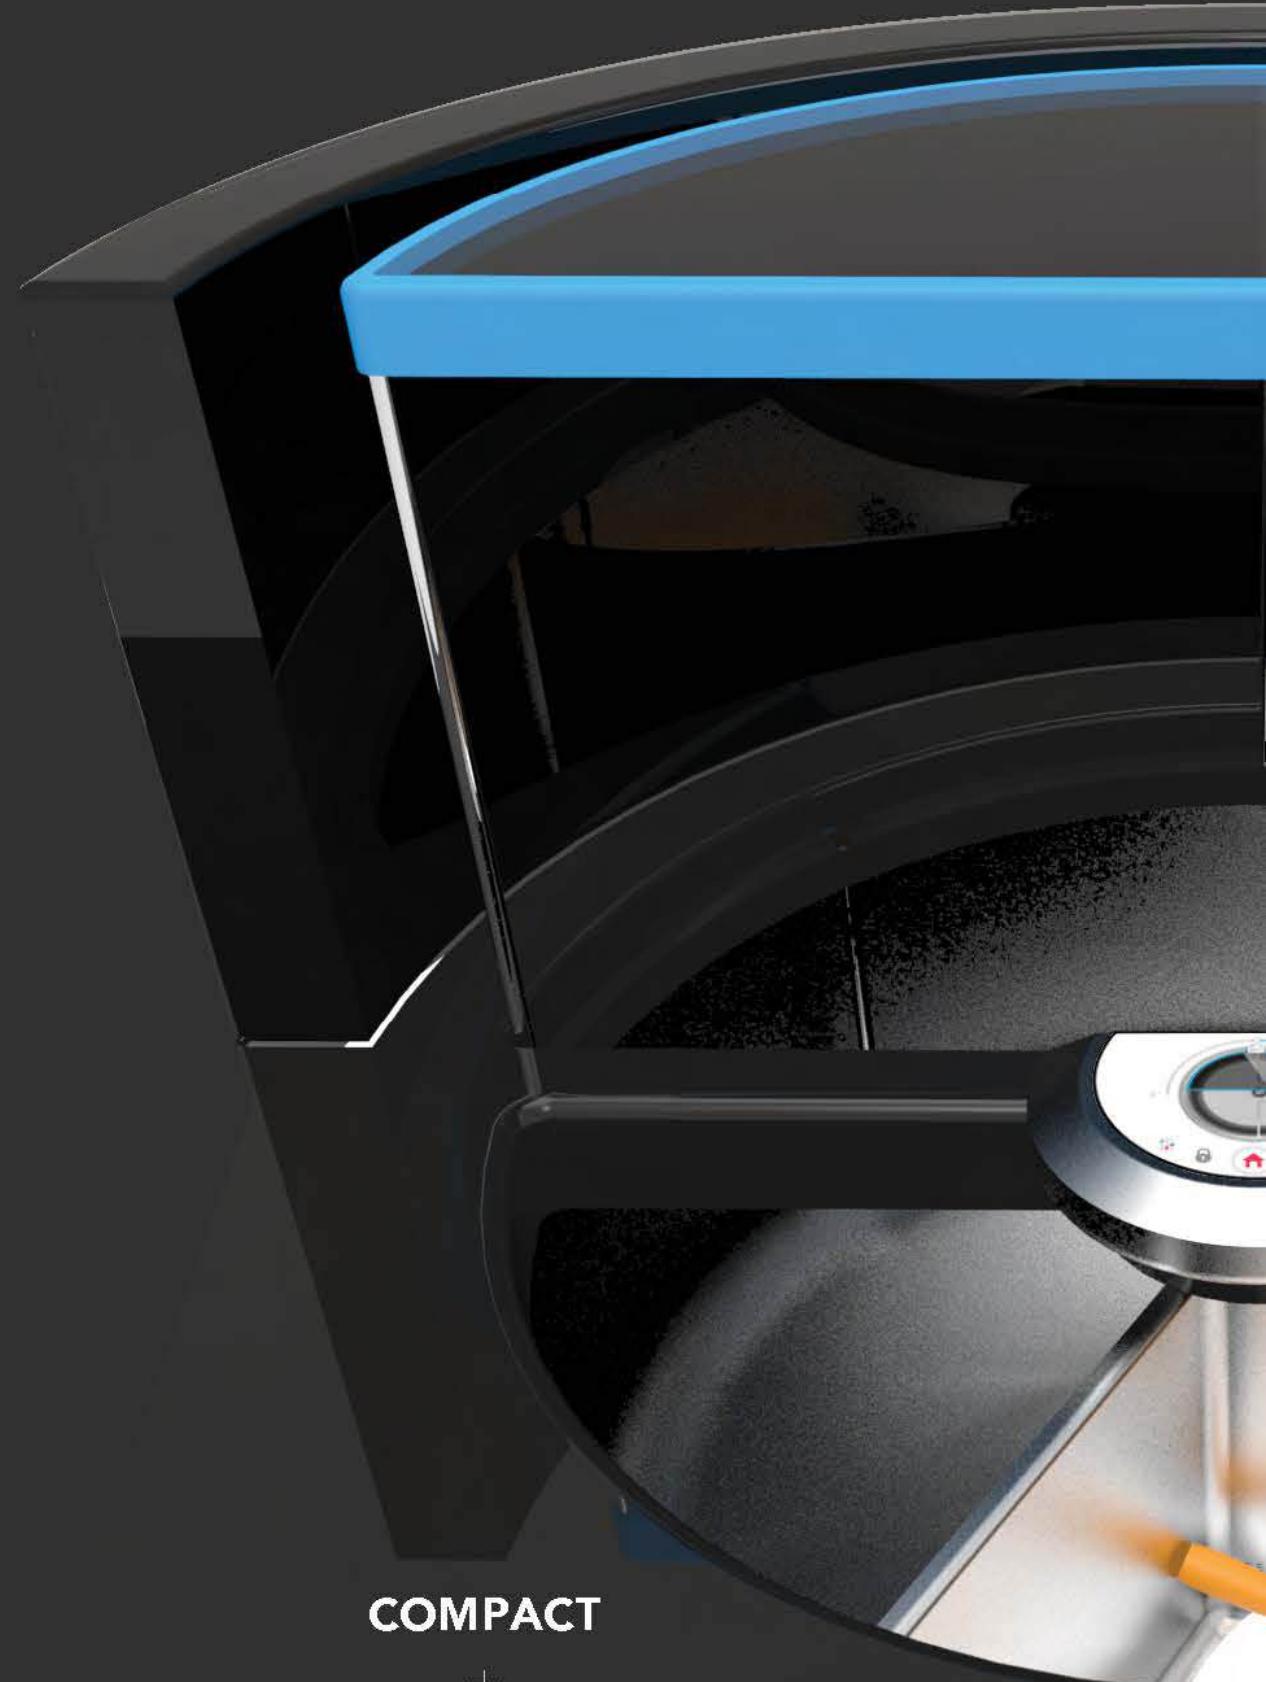

Simultaneous high-pressure water bombardment at multiple angles to ensure maximum efficiency in the usage of water for cleansing.

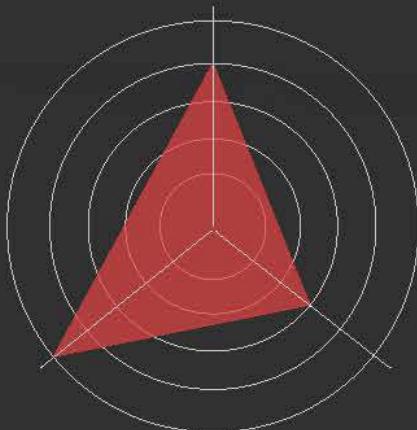

## Artificial Intelligence

Employment of A.I for detection of varying types of food stains and kitchenware materials for optimal cleansing techniques.

whenever a change in mind or to add more cutlery.

## DISHWASHER-SINK INTEGRATION

The rotating basin features dual purposes: functioning as both a sink and a dishwasher.

The project begins with a comprehensive research of space constraints within a modern apartment to initial concept sketches to visualise a design that seamlessly combines practicality and optimisation of the kitchen space.

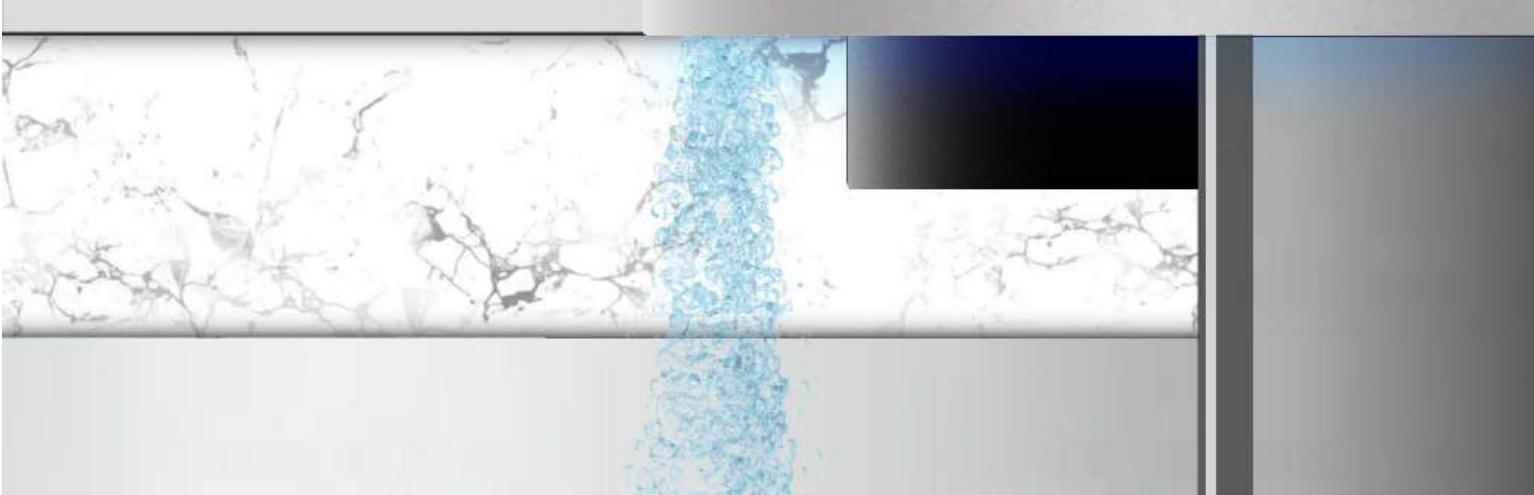

## DYNAMIC CONTROL CENTRE

Central to this design is a control center with a touch interface managing the entire cleaning cycle and facilitating seamless switching between sink and dishwasher modes.

The touch interface provides control over cycle types, water temperature, and cleaning intensity, allowing users to tailor the washing process to their specific needs.

The rotating mechanism is designed with user safety in mind, ensuring smooth transition, with sensors and a secure seal during dishwasher mode to prevent leaks.

## 1 INACTIVE

Use the faucet as per normal

In this stage, the user uses the sink for regular tasks like washing hands or rinsing fruits.

With a tap on the control center, the user activates the rotation, seamlessly switching the sink into dishwasher mode.

Sensors ensure that the transition is safe, providing an audible alert when the unit is fully locked in dishwasher mode.

## 2 PREPARING TO CLEAN

Load in cutlery and plates.

Once in dishwasher mode, the user loads dishes into the rotating basin. The user selects the desired cycle, customizing water temperature and washing intensity.

The dishwasher then initiates the cleaning process, with real-time updates visible on the touch screen, showing the estimated time remaining and cycle progress.

## 3 CLEANSING

Set and begin process

During the active cleaning stage, the integrated dishwasher utilises a rotating spray arm and targeted jets to efficiently clean dishes from multiple angles.

Advanced sensors monitor water pressure and temperature, while adjusting the cycle based on load weight or detected debris. The display provides notifications if any adjustments or issues arise during the cycle.

## 4 AFTER CLEANING

Unload cutlery and plates.

Upon completion of a cycle, the control center alerts the user with a melody. It then prompts the user to either let the dishes air-dry in place or remove them immediately.

After removing the dishes, the user can switch back to sink mode, smoothly transitioning back into a sink, ready for use, with all traces of its previous dishwasher role hidden beneath.

DESIGNED IN ISRAEL

DESIGNED IN ISRAEL

# Water From Air.

The industrial design centers around a state-of-the-art water dispenser that leverages breakthrough atmospheric water generation (AWG) technology. This innovation extracts water molecules directly from the surrounding air, condensing them into clean, potable water. T

The project's process begins with in-depth research into AWG capabilities and user needs, followed by concept development that balances aesthetics, functionality, and environmental impact. The design phase includes prototyping a sleek, user-friendly interface and an efficient, energy-saving mechanism for optimal performance in various climates.

Testing ensures durability, water purity, and seamless integration into both residential and commercial settings, prioritizing sustainability and accessibility.

Child Module

# GEN α

Water. From Air.

The system is designed with a "mother and child" structure, where the "mother" unit purifies air and generates water from atmospheric moisture, while the "child" unit is responsible for dispensing filtered water for drinking.

Water Generator

Vending Machine

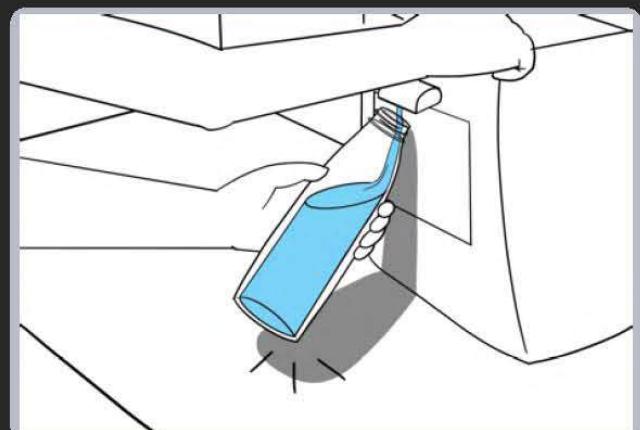

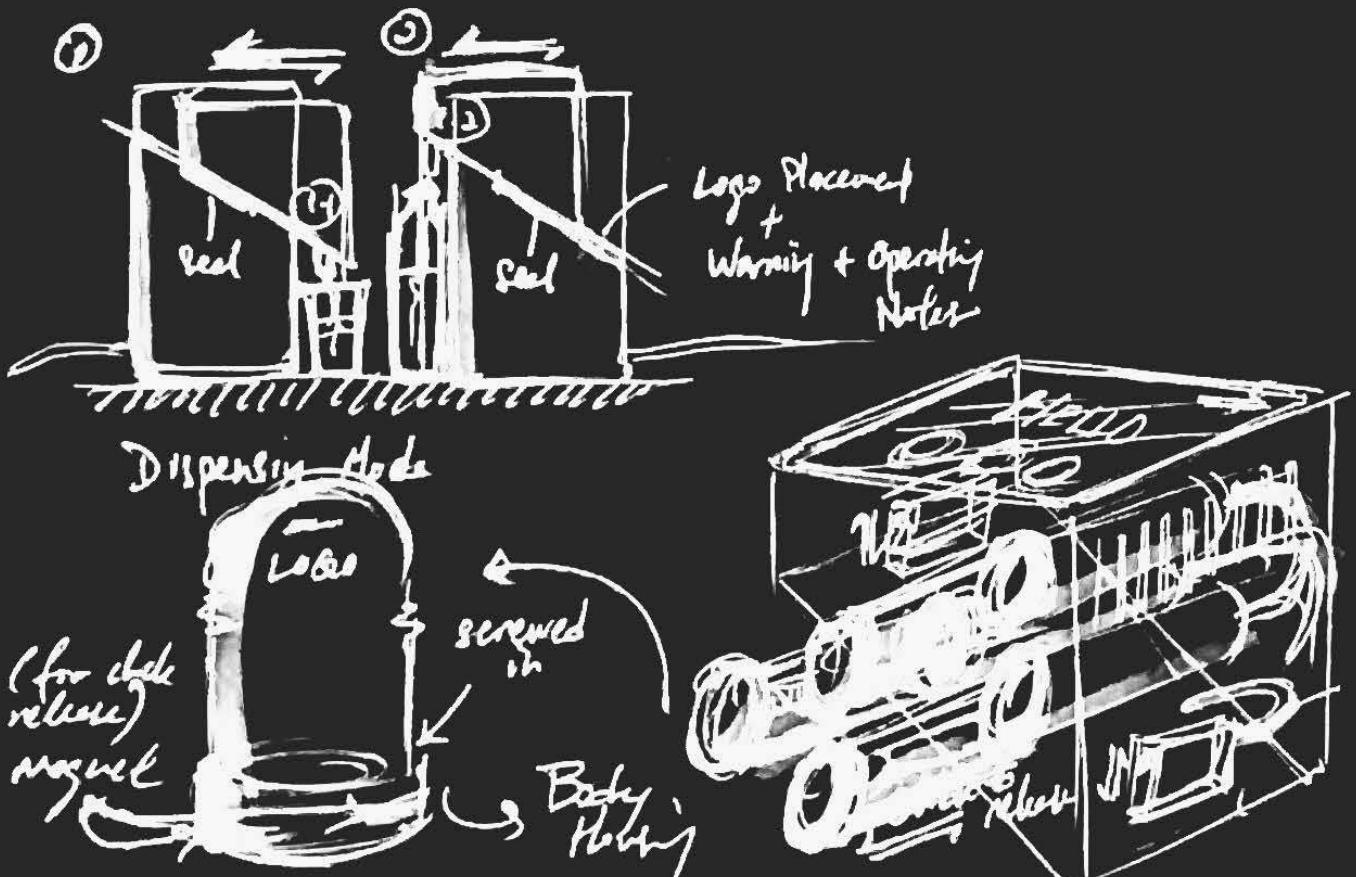

(De)Humidifier

The "child" unit, as the user-facing module, is connected directly to the mother unit, it receives purified water on demand, incorporating features such as haptic touch feedback and water temperature customisation.

Its streamlined, inconspicuous design is crafted to fit comfortably in common spaces like kitchens, offices, or waiting areas, allowing users to easily access fresh, clean water at any time.

All while the mother handles the sophisticated, behind-the-scenes work of water extraction and purification.

## HYDRATION THROUGH FLAVOURED WATER

Flavored water adds a refreshing twist to hydration, making it more appealing and enjoyable for those who struggle with plain water.

Infused with natural fruit extracts, herbs, or subtle sweeteners, it provides a burst of taste without added sugars or artificial additives.

This simple enhancement encourages better hydration habits, promoting overall health and well-being.

The dispenser incorporates a slide mechanism designed to seamlessly adjust and accommodate bottles and cups of various heights and sizes.

With a simple sliding motion, the dispenser's platform can be raised or lowered to ensure an optimum fit for containers ranging from small cups to large bottles, ensuring convenience and preventing spills.

## ONLY WHEN YOU NEED IT.

A hidden nozzle that retracts when not in use, maintains a clean, utilitarian appearance and also protects it from dust and contaminants. This design not only contributes to hygiene but also adds a touch of sophistication to the overall aesthetic.

The combination of the adjustable slide mechanism and the concealed nozzle makes this water dispenser a modern, solution that balances practical use with elegance.

# VISUALISED FILTER PLACEMENT.

Featuring a control center where buttons for dispensing flavored water are marked in CMYK-inspired colors, this aligning with users' intuitive associations between flavors and their respective colors.

This design leverages familiar visual cues to enhance the user experience and streamline selection. A glowing line connects each flavor cartridge to its corresponding button, creating a clear visual pathway that aids in easy identification and replacement of cartridges.

This thoughtful integration ensures both user-friendly operation and efficient maintenance.

The "Mother" unit serves as the core of the system, housing the atmospheric water generation (AWG) technology. It draws in atmospheric air, before condensing the moisture into water, and purifies the collected water through advanced filtration systems, ensuring it's safe and potable.

Designed to function independently, the mother unit continuously generates and replenishes water, adapting to humidity levels to maintain an efficient water production rate. Positioned out of sight or discreetly integrated within a space, the mother unit itself is a self-sustaining hub that supports the "Child" unit.

# **TECHNICAL SPECIFICATIONS: ADVANCED MOTHER UNIT: MAINTENANCE**

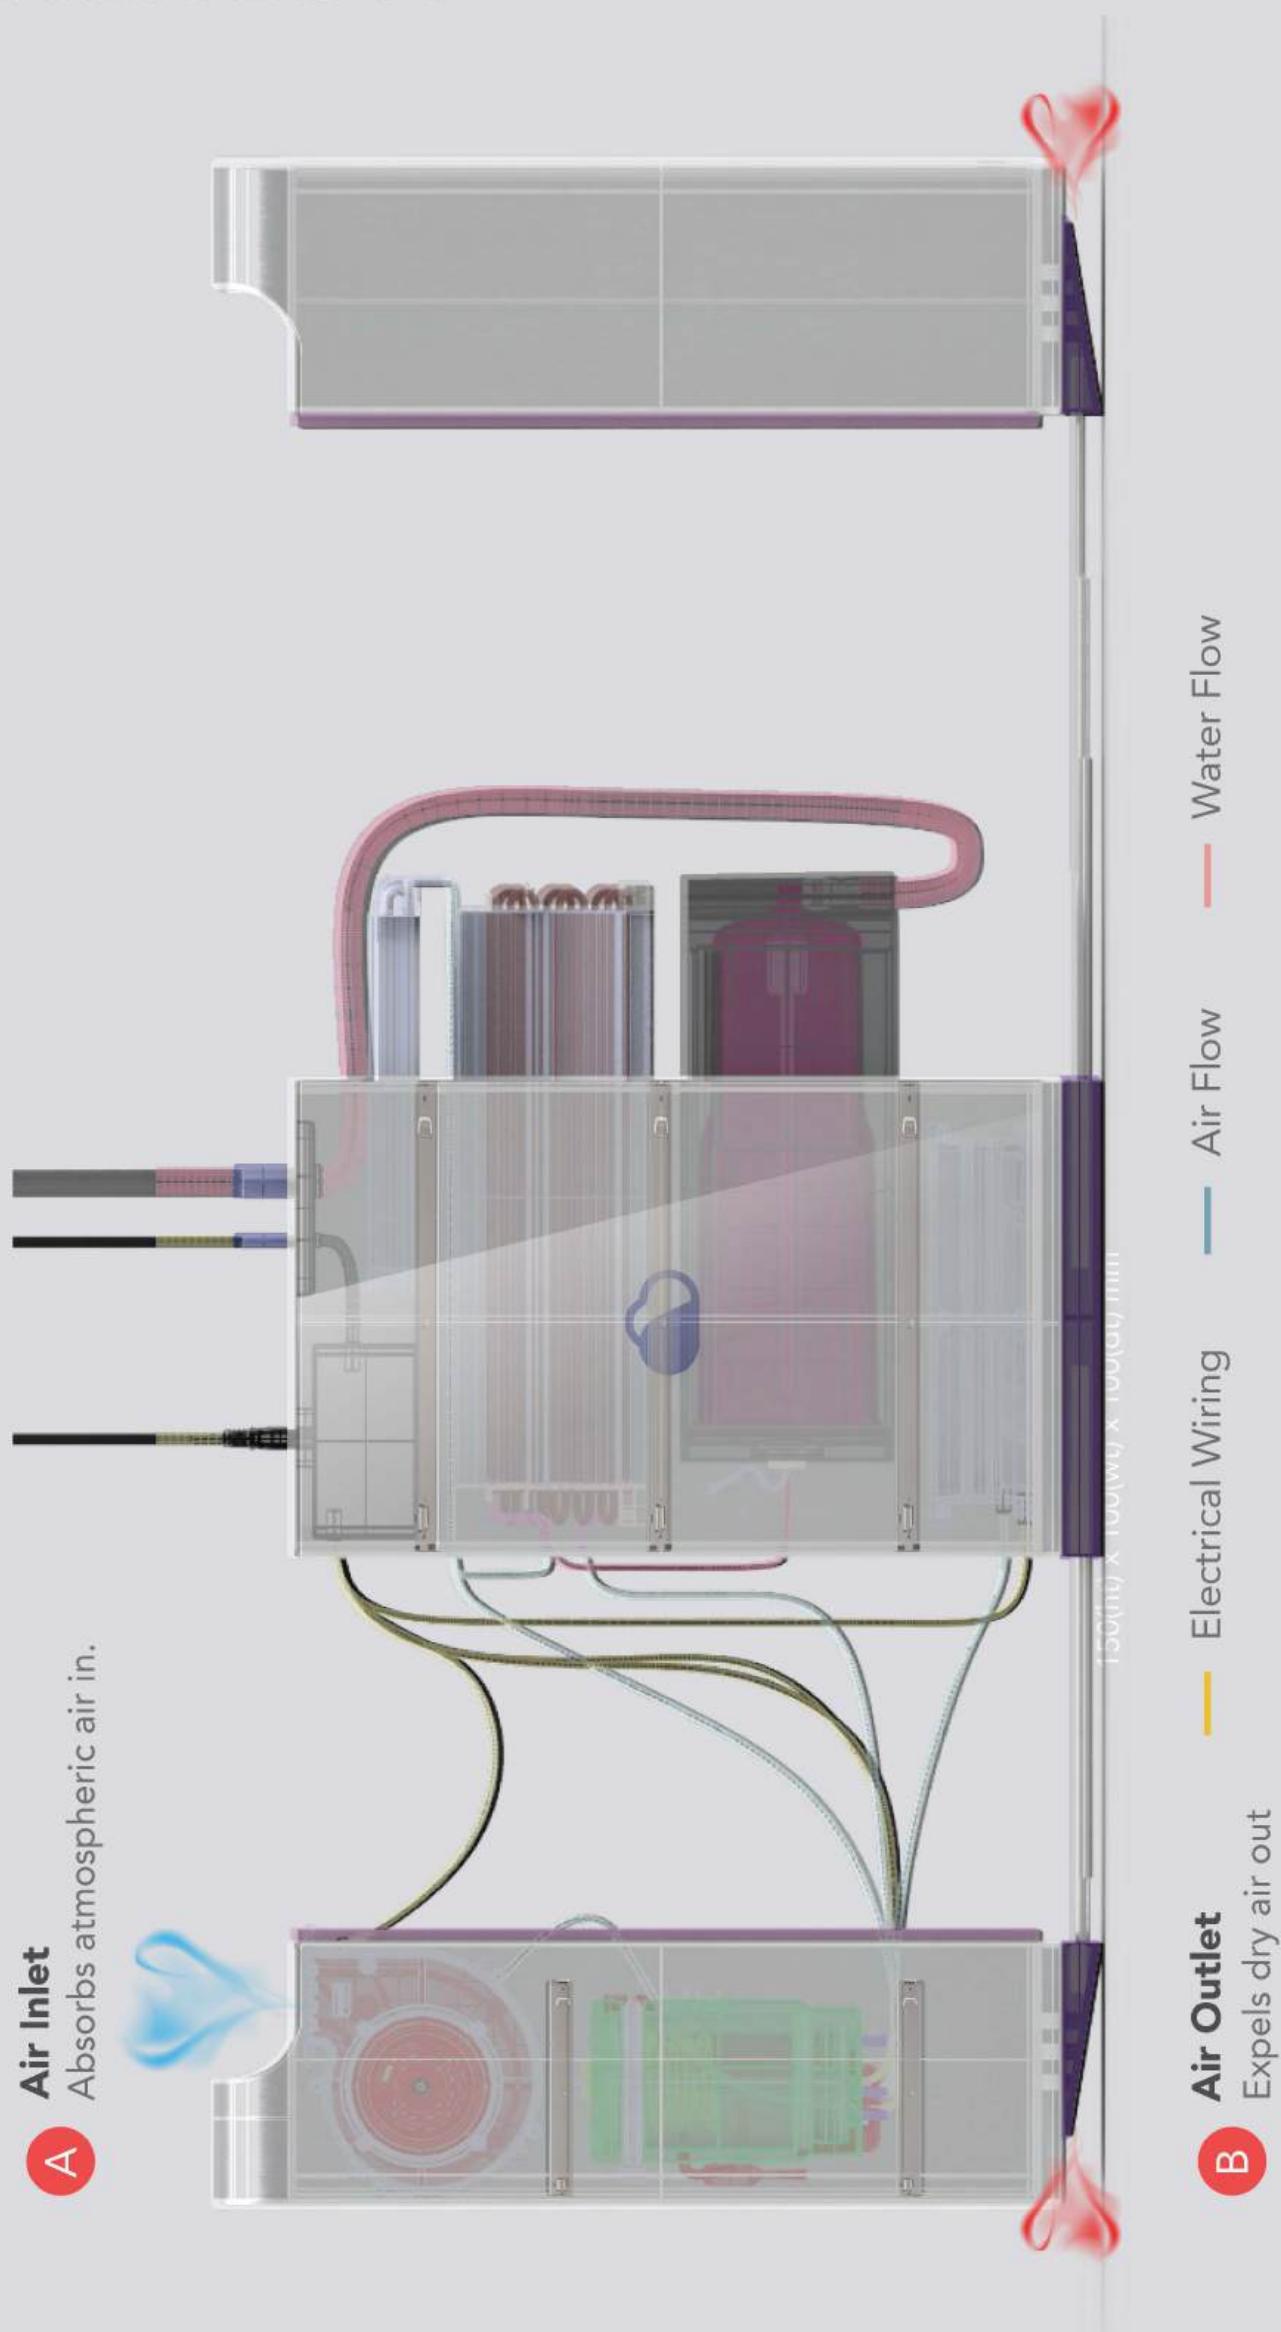

Designed to be straightforward and ensuring long-term performance with minimal effort, the unit features modular components that allow for easy access and replacement, including filters and condensation parts.

Automated alerts and smart diagnostics inform users when maintenance is required, such as filter changes or system checks. Regular upkeep involves basic cleaning and occasional replacement of key filters to maintain optimal water quality.

## 1 Raffles Town Plan 1824

The Raffles Town Plan was formulated in late 1822. The town plan focused on the downtown area, particularly around the Singapore River, and spanned from Telok Ayer to the Kallang River.

It was based on the vision that Singapore would be “a place of considerable magnitude and importance” and, as such, “an economical and proper allotment of the ground intended to form the site of the principal town [was] an object of first importance”.

The plan aimed to balance commercial, residential, and civic spaces, setting the stage for orderly urban development that would align with Singapore’s burgeoning status as a critical trading port in the region.

## 2 Ratification of 1819 Treaty

The ratification of the 1819 treaty secured British control over Singapore, formalizing its role as a key trading post. Signed by Sir Stamford Raffles, Sultan Hussein Shah, and the Temenggong, the treaty allowed Raffles to develop Singapore as a free port.

### 3 Treaty of Singapore 1819

On 6 February 1819, Stamford Raffles, Temenggong Abdu'r Rahman and Sultan Hussein Shah of Johor signed a treaty that gave the British East India Company (EIC) the right to set up a trading post in Singapore.

On that same day, the British flag was officially hoisted in Singapore, symbolizing the beginning of British sovereignty and the establishment of Singapore as a British settlement. This act marked a new chapter in Singapore's history, transitioning from a modest port to a central node in the British Empire's trade network.

The 200 Singapore Dollar banknote coincides with the nation's anniversary of establishing Singapore as a major trading port to both South East Asia and the World.

This banknote not only marks Singapore's early transformation from a modest island settlement into a bustling hub of global commerce but also celebrates the foresight and vision that positioned it as a key player in international trade.

This series is a tribute to the rich maritime heritage of Southeast Asia, celebrating the thalassocracies that once dominated the region's history. Each note showcases intricate designs featuring ancient seafaring empires like Srivijaya and Majapahit, whose influence extended across vast trade routes connecting distant shores. The detailed illustrations depict majestic ships, bustling port cities, and cultural symbols that highlight the power and prosperity brought by these maritime states. The series reflects the deep historical significance of these empires in shaping regional commerce, culture, and diplomacy.

SERIES

# Thalassocracies of Southeast Asia

Southeast Asia's thalassocracies, such as Srivijaya, Majapahit, and the Sultanate of Malacca, were powerful maritime empires that shaped the region's history through control of strategic trade routes. These seafaring states thrived on commerce, facilitating cultural and economic exchanges that connected the Indian Ocean with the South China Sea. Their dominance over maritime trade not only brought prosperity but also created a shared heritage of interconnected societies, emphasizing mutual benefit and collaboration across vast waters.

A shared currency themed around these thalassocracies would symbolize the collective history and economic strength of Southeast Asia. Such a currency could feature imagery of traditional ships, ancient port cities, and maritime motifs to celebrate the unity and cooperative spirit that defined these empires.

This theme would not only foster regional pride and identity but also inspire modern economic and cultural partnerships, underscoring the idea that the region prospers through interconnectedness and shared heritage.

In addition, the theme depicts the evolution of Southeast Asian unity and its connection to the world through trade.

Famous figures and iconic buildings are intentionally excluded so as to not be biased to any member state yet associable among Southeast Asians and also to ensure equal representation in the design as a common currency.

Gallery as Client Engagement

The project involves transforming a dilapidated villa into a vibrant art gallery, breathing new life into the historic structure and making it a cultural centerpiece. This revitalization aims to preserve the architectural integrity of the villa while reimagining its spaces to showcase contemporary and traditional artworks.

The gallery will feature rotating exhibitions, workshops, and events, creating a dynamic environment that attracts visitors and fosters local engagement. By integrating modern amenities and artistic elements, the project seeks to make the villa not only a destination for art lovers but also an appealing place to live.

Throughout the day, she might conduct workshops in an adjoining room, teaching painting techniques or creative concepts to eager participants.

Afternoon hours may be dedicated to guided tours, allowing her to share stories behind her art, fostering connections with patrons and enthusiasts.

In the early evening, the gallery may host an event such as a small artist talk or a cultural showcase. This allows her to live and breathe her art while connecting her life to her work, where her home becomes a living gallery that blurs the lines between personal space and public creativity.

The Smithsonian fish collection is one of the world's largest, with over 6 million specimens. This extensive collection serves as a crucial resource for scientific research and conservation efforts.

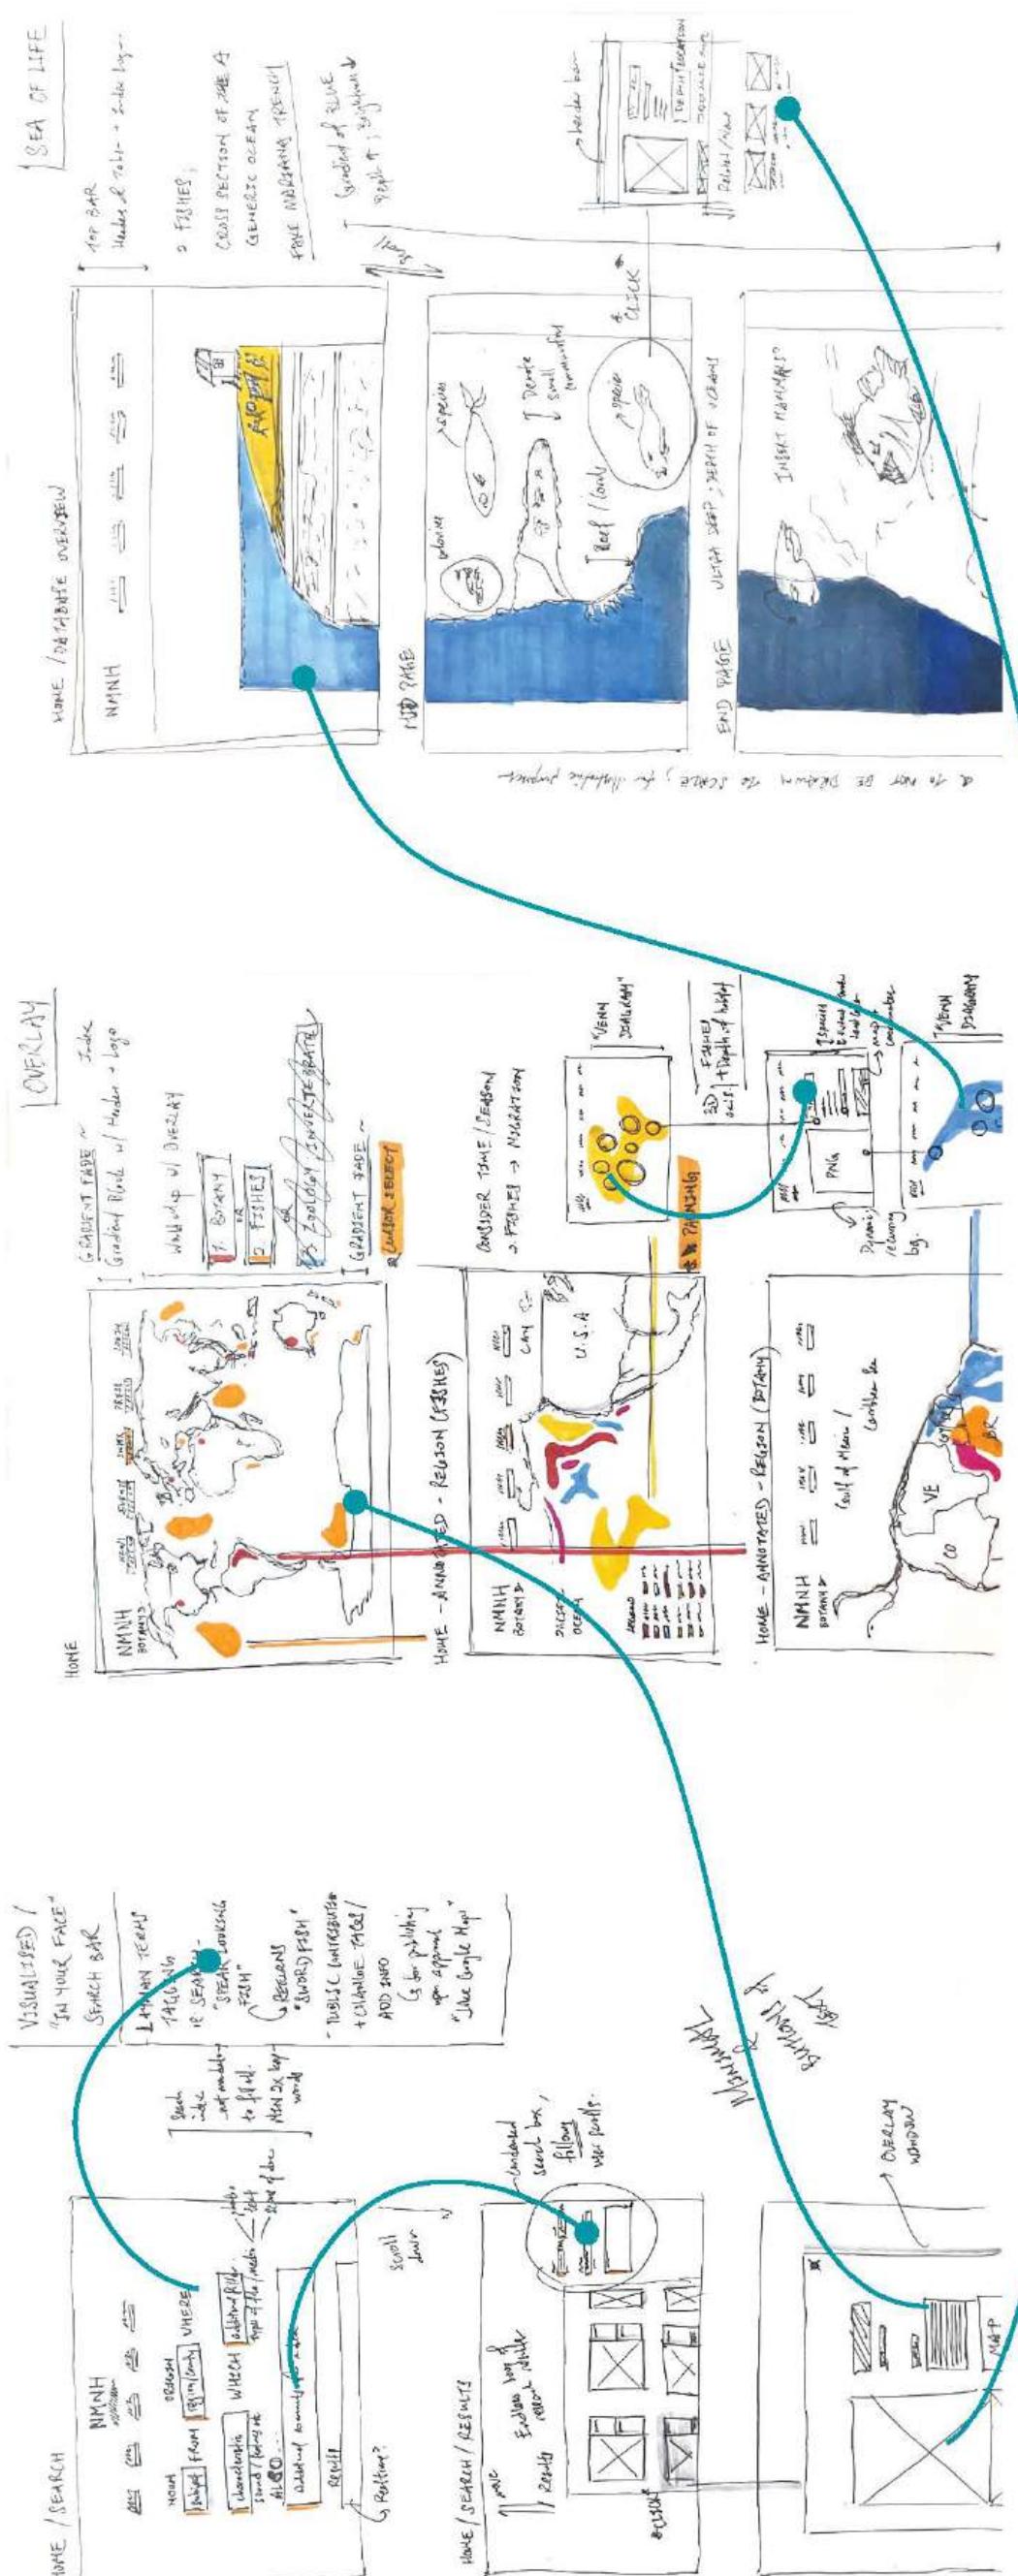

In this project, we dive into crafting a visualisation that uses depth as its main theme of illustrating the diversity of our oceans.

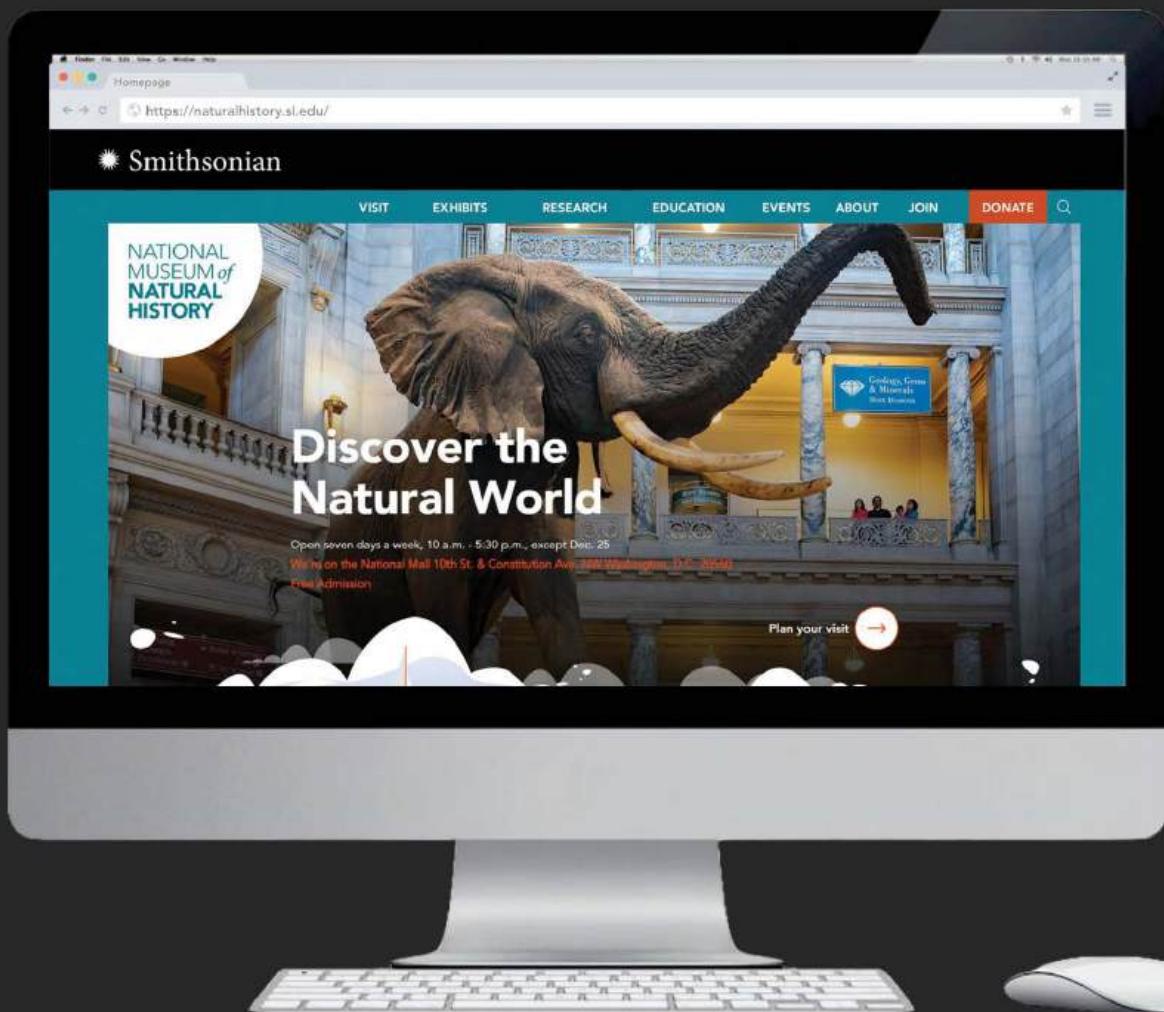

By using the depth data gathered from each fish, we move beyond simple categorization and enhance the storytelling potential of the information. The aim is to provide readers with an intuitive glimpse into the ecosystems of the deep, where various species coexist and thrive within overlapping environmental niches.

Through this approach, it deepens the audience's understanding of how biodiversity unfolds across different oceanic depths.

# 100 Years of Earthquakes around the World

A visualization mapping 100 years of earthquakes from 1923 to 2023 reveals a dynamic picture of global seismic activity, capturing the frequency, magnitude, and distribution of tremors across the planet.

It includes a world map overlaid with color-coded points or circles, where each point represents an earthquake event, with larger circles and deeper colors indicating higher magnitudes.

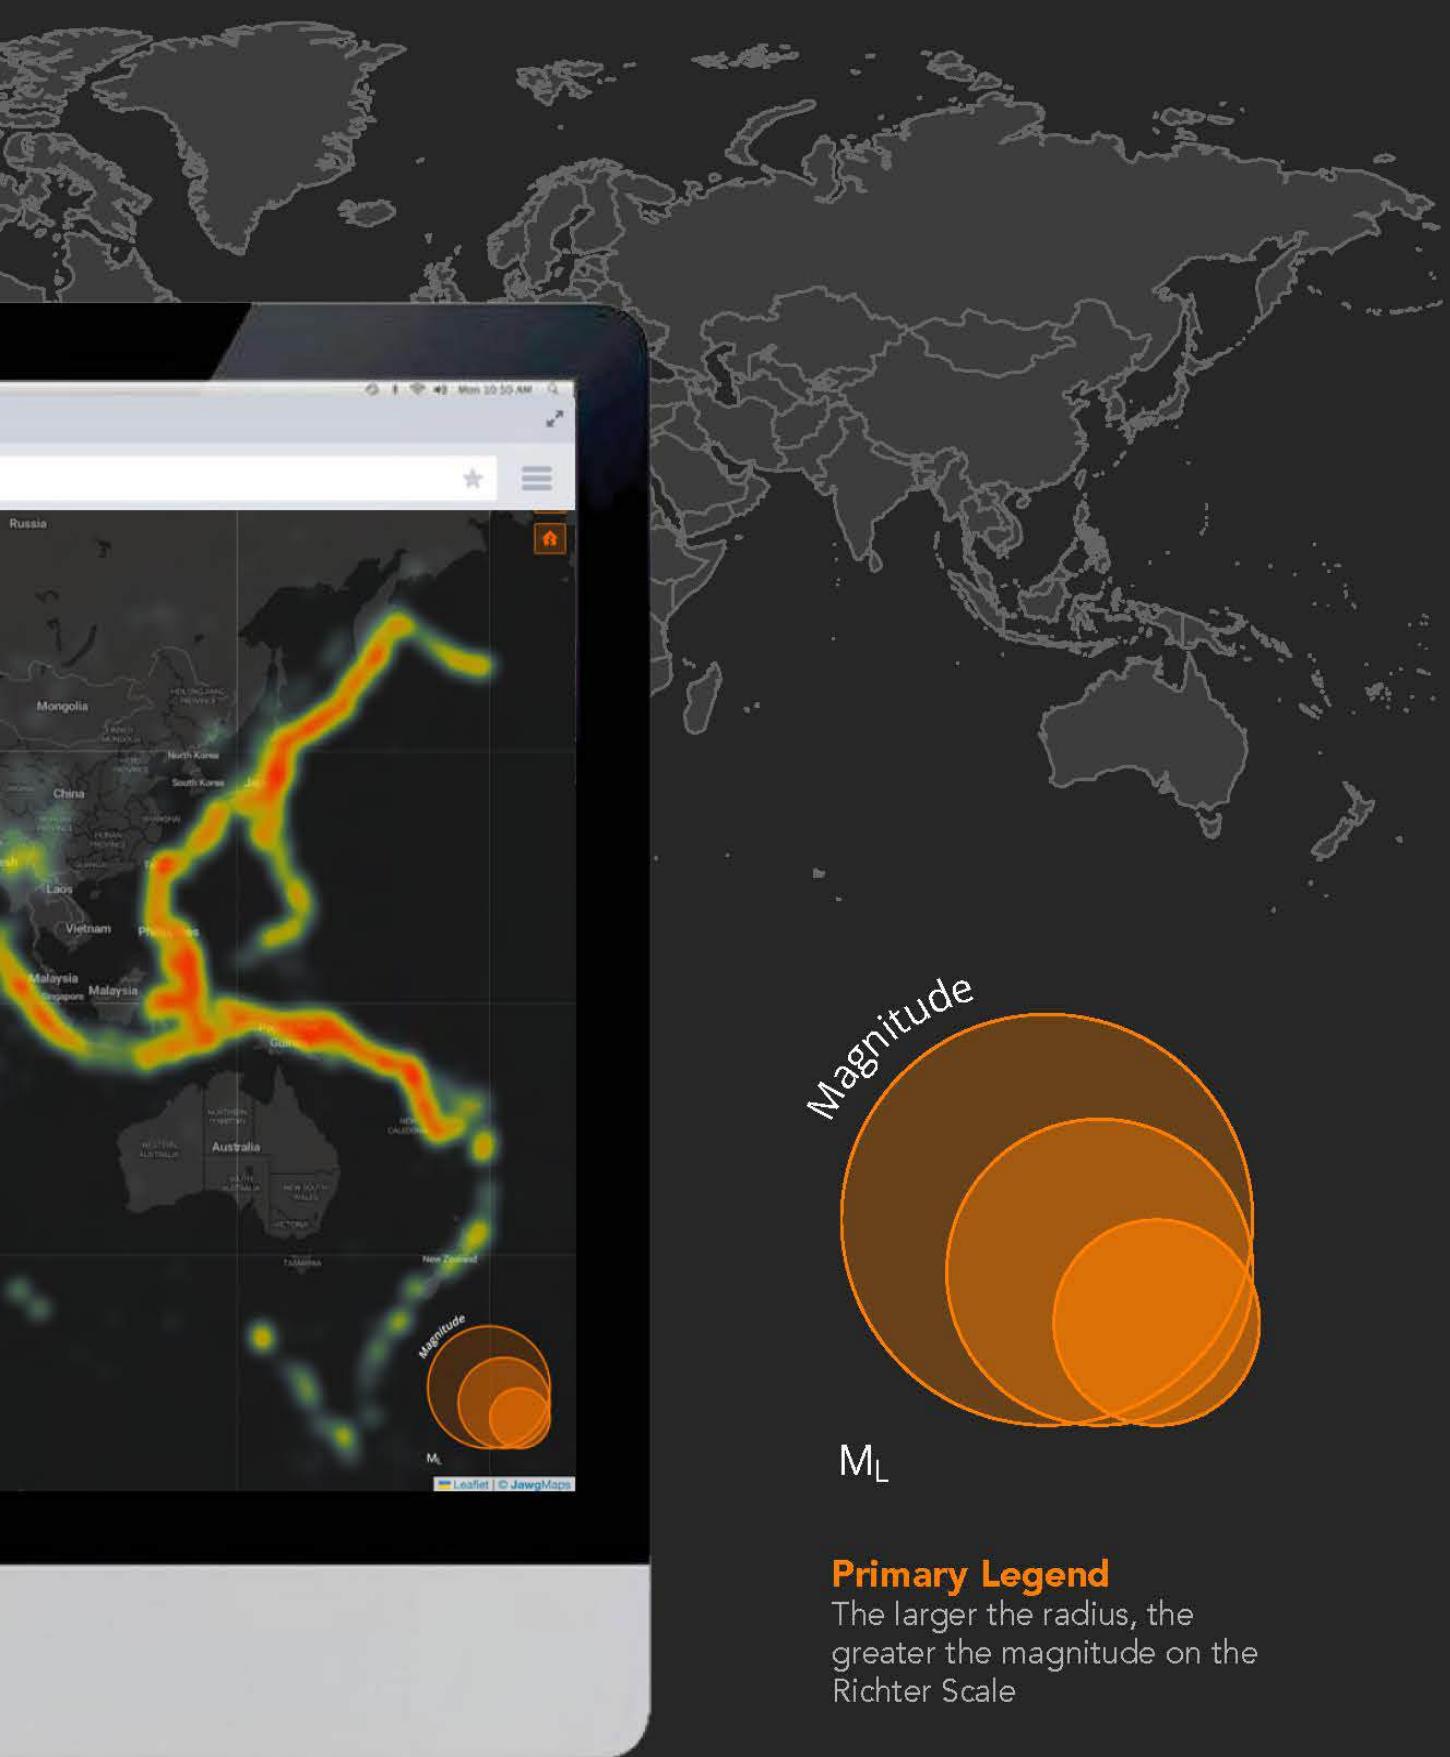

Temporal progression highlights earthquake patterns by decade, showing clusters in tectonically active zones like the Pacific "Ring of Fire" and areas around major fault lines in Asia, North and South America, and parts of Europe.

2004

Interactive features, like zooming into specific regions or filtering by magnitude and year, allow viewers to explore areas of interest or significant historical events, such as the 1964 Alaska earthquake or the 2011 Japan earthquake. An animated time-lapse effect brings the visualization to life, illustrating how seismic activity has shifted or intensified over the century.

#### Primary Legend

The larger the radius, the greater the magnitude on the Richter Scale

# Controls

## Home

Flies the map back to Southeast Asia, home to the Ring of Fire

## Heat Map Overlay

Toggles On / Off visibility of a Earthquake Heatmap

## Earthquakes Location Overlay

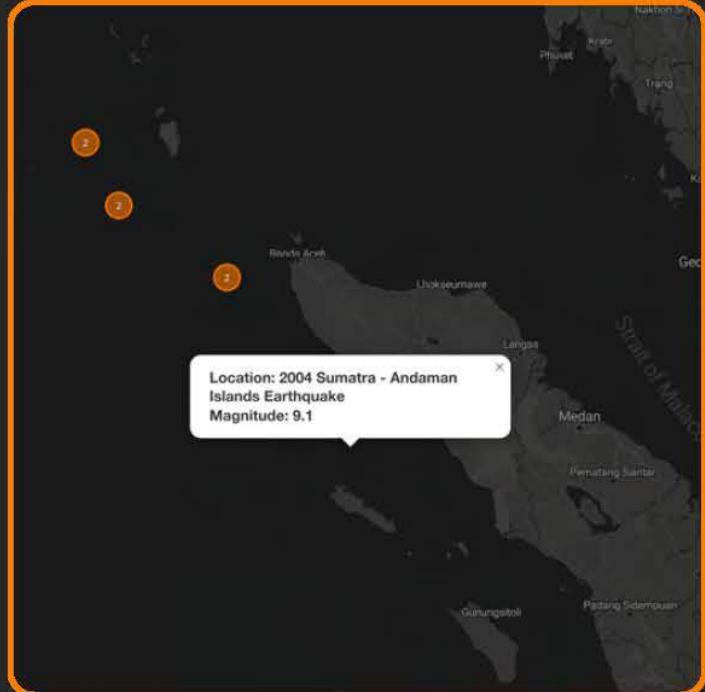

Toggles On / Off visibility of Earthquake Locations

# Gestures

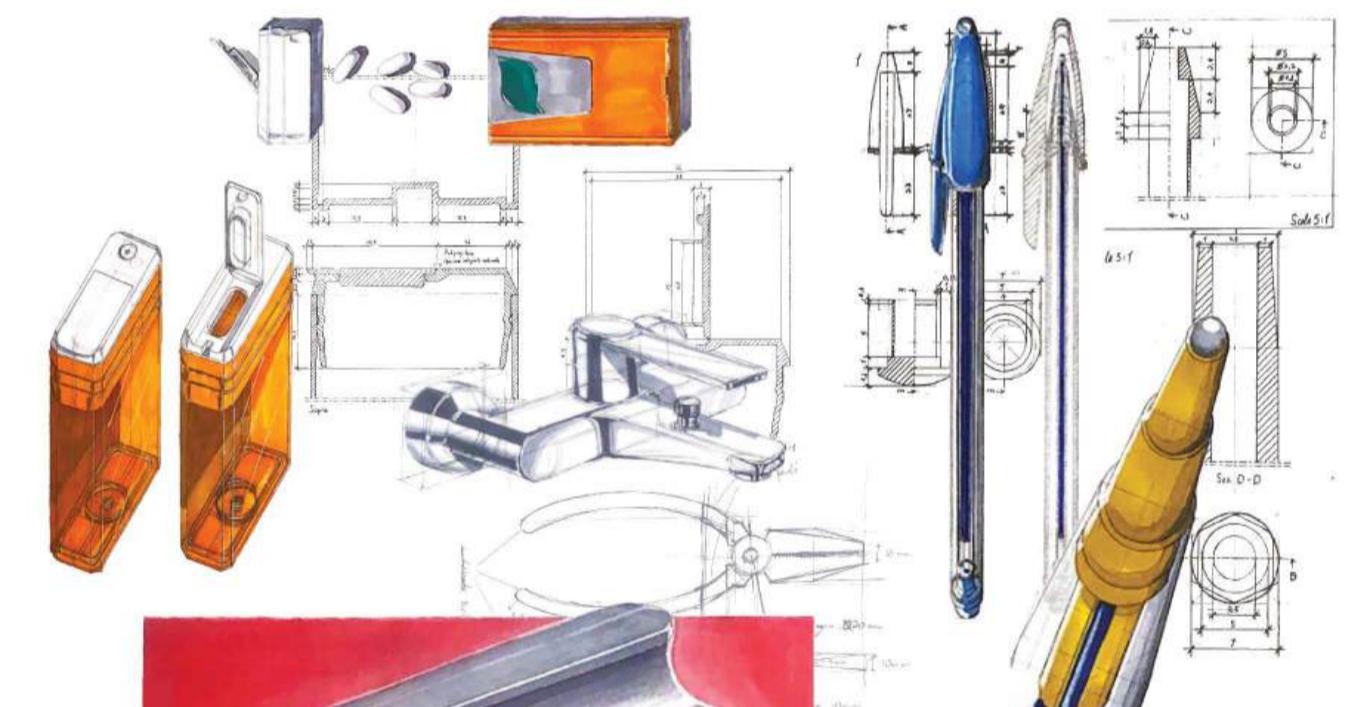

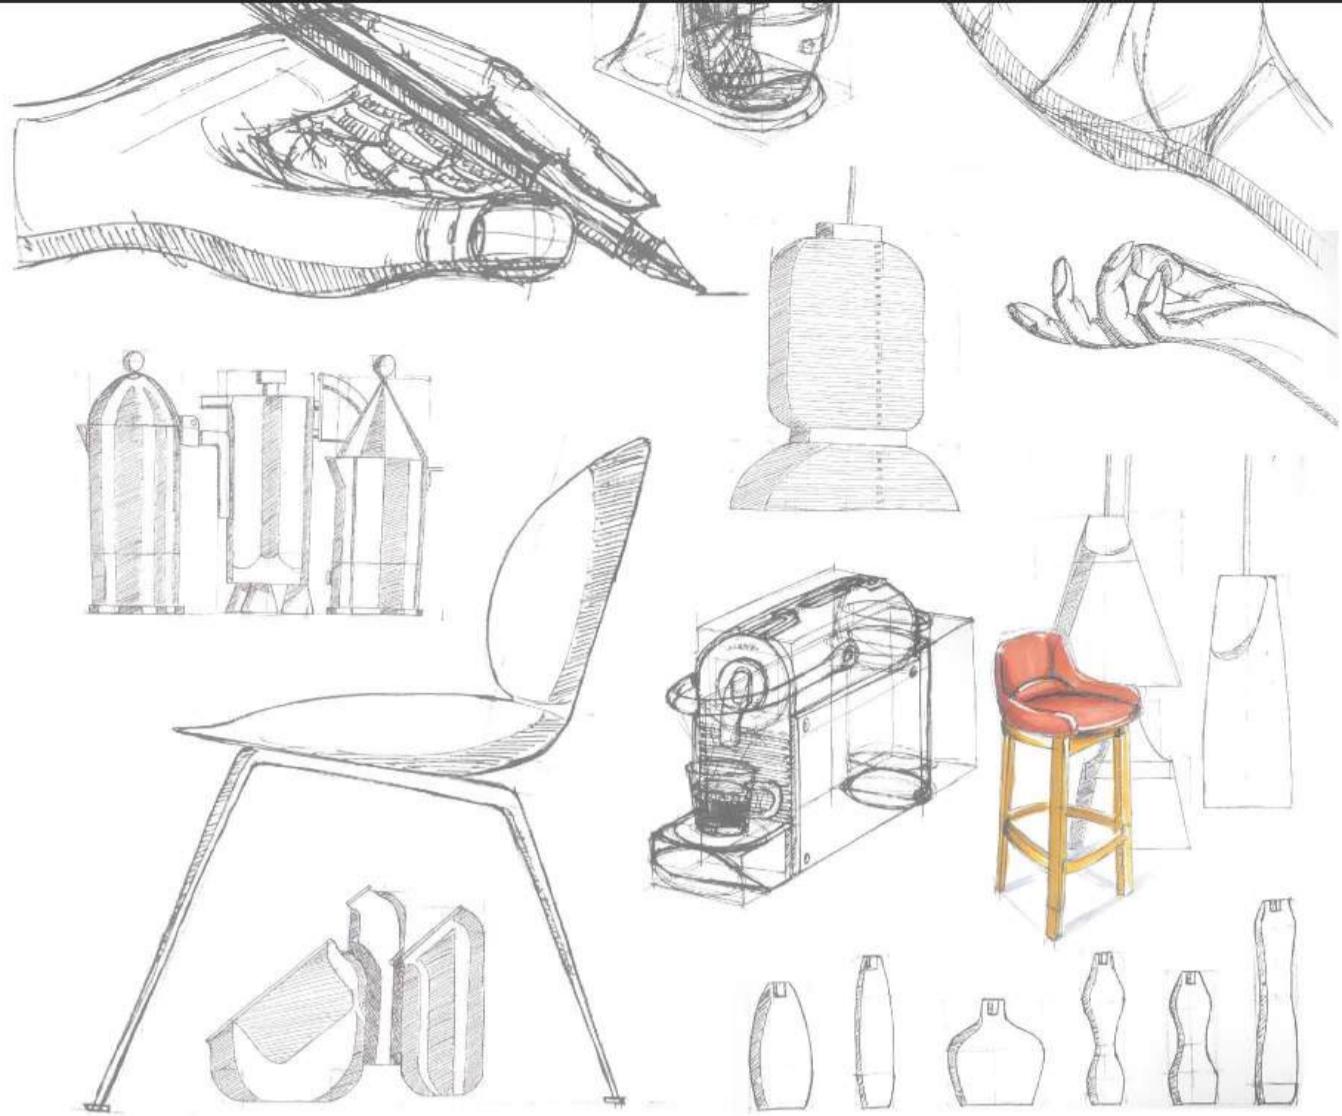

## Click

Toggles On / Off visibility of different layers.

## Hover

Toggles On / Off visibility of the Tooltip, with detailed information of a specific earthquake.
